Dubai Cosmetic Surgery becomes the first licensed clinic in the Middle East to offer the latest technology in hair transplant – Stem Cell FUE

As demand for permanent hair loss restoration continues to grow worldwide, Dubai Cosmetic Surgery is pleased to announce the introduction of **Stem Cell FUE (Follicular Unit Extraction)** hair transplant at its clinic in Dubai, UAE.

Stem Cell FUE hair transplant is a form of FUE, which utilises a micro-grafting technique allowing high hair density with minimal shock-loss instead of simply redistributing hair from one part of the scalp to another.

According to Ms Anisa Vrabac, Head of Hair Transplant at Dubai Cosmetic Surgery, Stem Cell FUE hair transplant, also known as Direct Automated FUE, is the latest form of FUE available in the market. "This is the most efficient and effective form of hair transplant technology to date and we are happy to finally have it here at Dubai Cosmetic Surgery."

"This Direct Automated FUE conducts high speed and high precision harvesting. Per session up to 4000+ grafts can be harvested safely (depending on donor capacity) while on the other hand 30% to 50% of the harvested sites will re-grow within 3 – 6 months," says Vrabac.

She adds, "Only Stem Cell FUE allows for the regrowth of harvested sites to occur in the donor area, which also results in faster healing compared to traditional FUE."

With Stem Cell FUE hair transplant technique, explains Vrabac, micro-grafts are often half the size compared to grafts from the conventional FUE methods hence double the amount of grafts can be placed per cm<sup>2</sup>, and triple the amount of grafts compared to the conventional FUT method, resulting in very high density results. "This fact makes it ideal for correcting BAD HAIR TRANSPLANTS, which leave many gaps and give low density results."

Stem Cell FUE transplant is ideal for volume restoration, is minimally invasive and allows faster healing for the donor area as well as the recipient area. "This is because of the micro harvesting from the donor site, and implantation right next to the original hair, hence appearing very natural with high density," states Vrabac.

Due to its extra fine diameter which gives it a more natural look, targeted areas for Stem Cell FUE hair transplant technique include the beard, moustache, goatee, eyebrows, and eyelashes. "This technique also relies on direct implantation of harvested grafts, which ensures it is the only way to eliminate failure rate, meaning that 100% of the implanted micro grafts are guaranteed to grow."
